From the hexane crude extract of the leaves of *Kopsia singaporensis*, the family of Apocynaceae, a mixture of three known triterpenes was identified. Three of them were pentacyclic triterpenes which consists of lupeol (lupane)**1**,  $\beta$ -amyrin (oleanane)**2** and  $\alpha$ -myrin (ursane)**3**. The components in the mixture were identified using spectroscopic methods and also comparison with data from the literature.

**Keywords:** *Kopsia singaporensis*, Triterpenes, Lupeol,  $\beta$ -amyrin,  $\alpha$ -amyrin.
